TRIP DNA

Tourism and Cultural Exchange

A travel itinerary can look perfect on paper and still fall apart in reality.

Trip DNA helps travellers identify potential failures before their journey begins—and repair their plans before those failures become real problems

THE Problem

1

Unrealistic Itineraries
Perfect Plans, Real Problems

Packed itineraries leave little room for delays, long queues, or unexpected changes.

2

The Domino Effect
One Delay, Many Disruptions

A missed train or late arrival can affect multiple bookings and activities.

3

No Smart Recovery
No Clear Recovery Plan

Travellers often struggle to decide what to change without losing must-see experiences.

“The problem isn't creating a plan. It's knowing how to save it when things go wrong.”

OUR SOLUTION

1. **PLAN- Build your itineray**
   Enter activities, timings, travel durations, booking constraints, and must-do experiences.

2. ***STRESS-TEST — Simulate a disruption***
   Introduce a scenario such as a simulated 40-minute delay, bad weather, or an unavailable attraction.

3. ***DETECT — Reveal the domino effect***
   *Id*entify timing conflicts, insufficient buffers, and downstream activities that may be affected.

4. ***REPAIR — Repair with Minimal Changes***
   Adjust flexible activities and suggest alternatives while preserving must-do experiences.

“Trip DNA doesn't just create itineraries. It stress-tests them, reveals the domino effect, and finds the best feasible recovery plan.”

USP

Unique Selling Point

1 Failure Injection

Test your itinerary against hypothetical delays, missed connections and unexpected changes before your trip begins.

2 Domino Effect Mapping

See how one disruption affects later activities, bookings and travel connections in your itinerary.

3 Minimal-Change Repair

Get alternative plans that fix the disruption while preserving your must-visit places and favourite experiences.

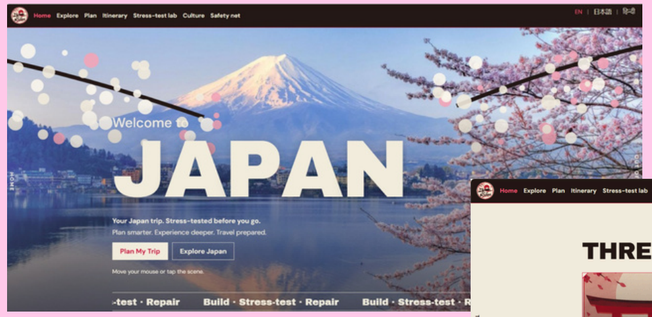

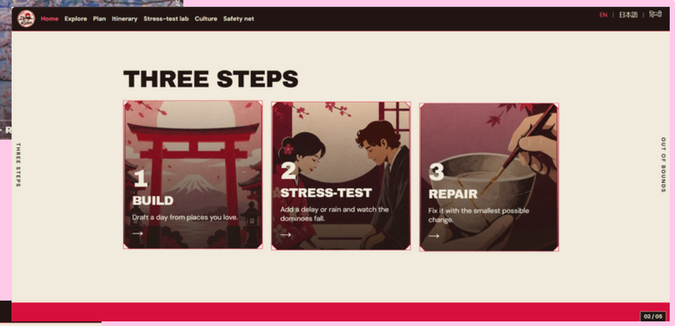

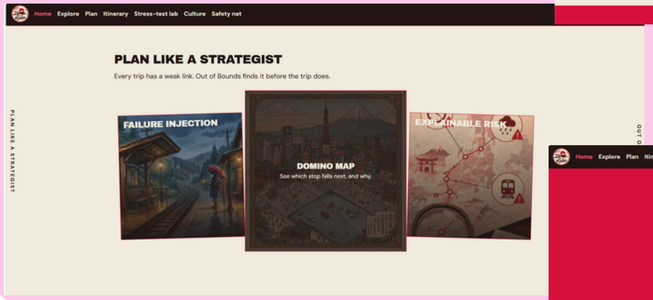

“We don't just plan your trip. We test it, trace the risks, & help save it.”

Impact & Feasibility Overview

Expected Impact

Trip DNA helps travellers identify itinerary risks before departure, understand how disruptions affect their plans, and recover while preserving must-visit experiences. Its cultural guide also encourages deeper exploration of Japan beyond popular tourist attractions.

Technical Feasibility

Our prototype will combine an interactive Japan map, a personalised itinerary builder, a rule-based risk checker, and a disruption simulator. A before-and-after itinerary comparison will demonstrate how the system detects problems and suggests minimal-change repairs.
